

About macKLIPS®

The idea was formed when I was working as an electrician and became repeatedly frustrated with the amount of time wasted while installing cables.

Even more disheartened when the client would change their mind and the re-routing of cables would have to be done. The old fashioned and slow methods of individual cable clipping or supporting cables with scraps of cable were not working.

Please take a few minutes to turn the page and see our macKLIPS® MK-001, a product we feel will change the methods of supporting products throughout every stage of a project.

SPEED UP THE INSTALLATION PROCESS

From packet to finished fixed location
in under 20 seconds (approx.)

MAKE THE WORKPLACE A SAFE ENVIRONMENT

macKLIPS® can be located before any
required item is installed, therefore
when inserted, the components are
instantly supported by the strap which
keeps both the installer and products
safe during the whole process.

IDEAL FOR MODIFICATIONS

You can detach the dominant end of the
macKLIP while leaving the collared end
securely fixed into position. This now
gives the opportunity to disconnect and
reconnect to add or modify items as
many times as required.

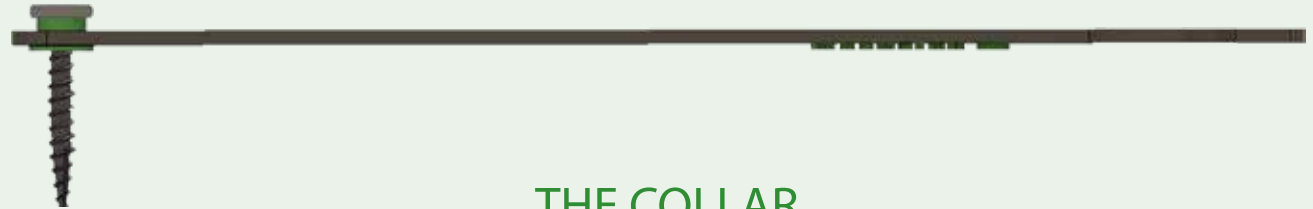

STRAP STRENGTH

The macKLIPS® strap is made from Thermoplastic Elastomer (TPE) which naturally
gives fantastic characteristics like:

GREAT RESISTANCE TO TEMPERATURE (-30°C TO 80°C)

HIGH STRENGTH

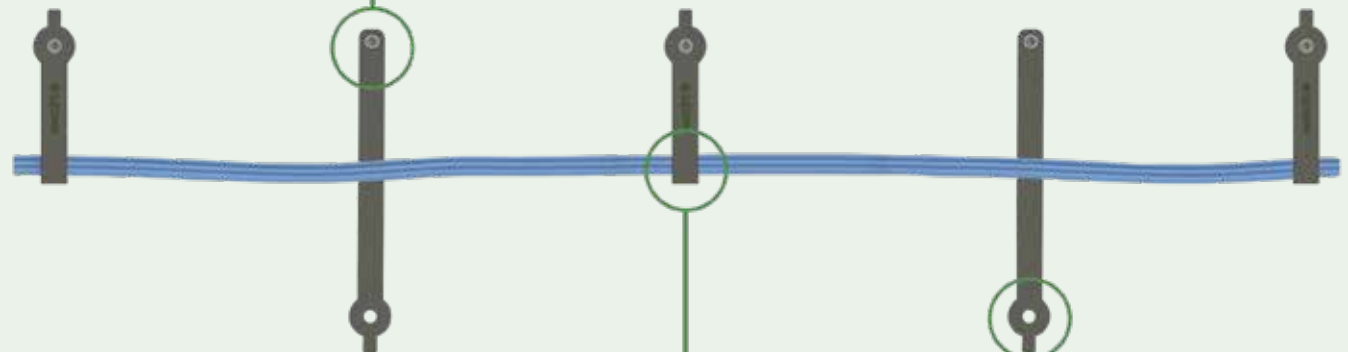

EXCELLENT RESISTANCE TO CHEMICALS

THE COLLAR

Designed to restrict the screw's head to be completely inserted into the desired
location. This now leaves the head of the screw to be exposed to permit the hole in
the dominant end of the strap to be securely placed over and into position.

WHEN THE FIXED END IS INSTALLED TO THE DESIRED
LOCATION, YOU CAN DISCONNECT AND RECONNECT THE
DOMINANT END AS MANY TIMES AS REQUIRED.

MANAGE ITEMS WITHIN THE WHOLE
INSTALLATION PROCESS WITH EASE
AND SPEED TO MAINTAIN A SAFE
ENVIRONMENT OF WORK

DISCONNECT THE DOMINANT END OF
THE macKLIPS® TO ADD ADDITIONAL
ITEMS. WHILST LEAVING THE
OPPOSITE END SECURELY FIXED.
